Hydrological Cycle and Its Components

The Hydrological Cycle

At the core of hydrology lies the hydrological cycle—a continuous movement of water within the Earth-atmosphere system involving processes such as evaporation, condensation, precipitation, infiltration, runoff, and subsurface flow. Understanding this cycle enables engineers to predict water availability and variability.

Major Components

1. Precipitation: Rainfall, snowfall, and other forms of water input. 2. Infiltration: Water soaking into the soil, replenishing groundwater. 3. Surface Runoff: Excess water flowing over land surface toward streams and rivers. 4. Evaporation and Transpiration: Water loss to the atmosphere. 5. Percolation and Groundwater Flow: Movement of water through soil and rocks. Each component influences water resource planning, flood forecasting, and environmental management.

Hydrological Data Collection and Analysis
