3. Frequency distributions

Application: Understanding the average level of anxiety in a population or the typical score on a personality inventory.

Inferential Statistics

Purpose: To draw conclusions about a larger population based on sample data.

Common Tests:

1. t-tests (comparing two groups)
2. ANOVA (comparing multiple groups)
3. Chi-square tests (examining relationships between categorical variables)

Application: Determining whether a new therapy significantly reduces depression scores compared to a control group.

Correlation and Regression Analysis

1. Correlation: Measures the strength and direction of the relationship between two variables (e.g., stress levels and academic performance).
2. Regression: Explores how multiple variables predict an outcome (e.g., predicting job satisfaction based on personality traits, work environment, and sleep quality).

Application: Identifying predictors of resilience or vulnerability in mental health.

Factor Analysis and Structural Equation Modeling (SEM)

Factor Analysis: Reduces complex data sets by identifying underlying latent variables (factors). Used in developing and validating psychological scales.

SEM: Combines factor analysis and regression to test complex theoretical models involving multiple variables and pathways.

Application: Validating a new anxiety scale or testing a theory of cognitive processes.

Non-Parametric Tests

Useful when data do not meet the assumptions of parametric tests (e.g., normal distribution). Examples include Mann-Whitney U test and Kruskal-Wallis test.
