Sample NBME 15 Questions with Detailed Explanations

Question 1: A 65-year-old man presents with sudden onset chest pain radiating to his back. Blood pressure is different in both arms. What is the most probable diagnosis?

Options: - A) Myocardial infarction - B) Aortic dissection - C) Pulmonary embolism - D) Pericarditis

Correct Answer: B) Aortic dissection Explanation: This clinical scenario suggests an aortic dissection, characterized by sudden, severe chest pain radiating to the back and differential blood pressures between arms. The key features include: - Sudden onset tearing chest pain - Radiating pain to the back - Discrepancy in blood pressure readings The pathophysiology involves a tear in the intimal layer of the aorta, allowing blood to create a false lumen. Immediate diagnosis is critical because of the high mortality rate. Diagnostic imaging such as CT angiography confirms the diagnosis. Why not the others? - A) Myocardial infarction typically presents with chest pain but lacks the radiating back pain and blood pressure discrepancy. - C) Pulmonary embolism causes chest pain and dyspnea but usually not the differential blood pressures. - D) Pericarditis presents with chest pain that worsens with inspiration and positional changes, not with differential BP.

Question 2: A 25-year-old woman reports weight loss, heat intolerance, and palpitations. Physical exam reveals tachycardia and a diffuse goiter. What is the most likely diagnosis?

Options: - A) Hashimoto's thyroiditis - B) Graves' disease - C) Toxic multinodular goiter - D) Thyroid adenoma

Correct Answer: B) Graves' disease Explanation: The presentation is classic for hyperthyroidism, especially Graves' disease: - Symptoms: weight loss, heat intolerance, palpitations - Physical exam: tachycardia, diffuse goiter Graves' disease is an autoimmune condition where TSH receptor antibodies stimulate the thyroid gland, causing overproduction of thyroid hormones and diffuse goiter. Key features supporting Graves' disease: - Exophthalmos (not mentioned but characteristic) - Diffuse goiter - Symptoms of increased metabolism Why not others? - A) Hashimoto's typically causes hypothyroidism with weight gain, cold intolerance, and a firm, enlarged thyroid. - C) Toxic multinodular goiter involves multiple nodules, often presenting with a nodular or irregular thyroid rather than diffuse. - D) Thyroid adenoma usually causes a solitary nodule, not diffuse enlargement.

Deep Dive into Specific Answer Explanations

Case Study: A Patient with Elevated Serum Creatinine and Hematuria

Question: A 40-year-old woman presents with hematuria, proteinuria, and elevated serum creatinine. She reports recent sore throat and arthralgia. What is the most probable diagnosis? Options: - A) IgA nephropathy - B) Post-infectious glomerulonephritis - C) Lupus nephritis - D) Alport syndrome Correct Answer: B) Post-infectious glomerulonephritis Explanation: This patient's history suggests a post-infectious etiology: - Recent sore throat indicates a streptococcal infection. - Hematuria, proteinuria, and elevated creatinine point to glomerular damage. - Post-infectious glomerulonephritis commonly occurs after streptococcal infections, especially in young adults. Pathophysiology: Immune complex deposition in glomeruli triggers inflammation, leading to hematuria and proteinuria. The classic presentation involves "cola-colored" urine, reflecting hematuria. Additional clues: - The presence of recent infection aligns with this diagnosis. - Complement levels (C3) are often low initially. Other options: - A) IgA nephropathy presents with episodic hematuria concurrent with infections but without the systemic history. - C) Lupus nephritis involves systemic autoimmune features. - D) Alport syndrome is inherited, with hematuria starting in childhood.
