Unix interview questions for production support

Working in production support involves ensuring the stability, performance, and security of Unix-based systems that run critical business applications.

Candidates aiming for roles in this domain need to demonstrate a solid understanding of Unix fundamentals, troubleshooting skills, and familiarity with system administration tasks. Preparing for Unix interview questions tailored for production support can significantly improve your chances of securing such a role. This article delves into common interview questions, their explanations, and tips to help you prepare effectively.

Fundamental Unix Concepts and Commands

1. What is Unix, and how does it differ from Linux?

- Answer: Unix is a powerful, multi-user, multitasking operating system originally developed in the 1970s at Bell Labs. It is known for its stability, security, and portability. Linux, on the other hand, is an open-source Unix-like operating system inspired by Unix principles. While Unix systems are often proprietary (e.g., Solaris, AIX, HP-UX), Linux distributions (e.g., Ubuntu, CentOS) are open-source. Both share many commands and concepts but differ in licensing, kernel architecture, and system management tools.

2. Explain the significance of the /etc/passwd and /etc/shadow files.

- Answer: - `/etc/passwd` stores user account information such as username, user ID (UID), group ID (GID), home directory, and default shell. It is world-readable but no longer stores password hashes for security reasons. - `/etc/shadow` contains encrypted password hashes and account aging information. It is accessible only by privileged users. Proper management of these files is critical for security.

3. Describe the different types of permissions in Unix and how they are represented.

- Answer: Permissions determine who can read, write, or execute a file or directory. They are represented in three categories: - User (u): Owner of the file. - Group (g): Users in the file's group. - Others (o): Everyone else. Permissions are displayed as `rwx` (read, write, execute). For example, `-rwxr-xr--` indicates: - Owner: read, write, execute - Group: read, execute - Others: read only

System Administration and Management

4. How do you check system uptime and load average?

- Answer: - Use the `uptime` command to view system uptime and load averages: uptime Output example: 10:25:32 up 15 days, 4:22, 3 users, load average: 0.15, 0.20, 0.25 - Alternatively, `top` or `w` commands provide real-time system load and user information.

5. How can you identify which processes are consuming the most CPU or memory?

- Answer: - Use the `top` command, which provides an interactive, real-time view of processes sorted by CPU or memory usage. - For non-interactive, scriptable output: - For CPU: `ps aux --sort=-%cpu | head -n 10` - For Memory: `ps aux --sort=-%mem | head -n 10`

6. Describe the process of checking disk space utilization.

- Answer: - Use the `df -h` command to check disk space in human-readable format: `df -h` - To check inode usage: `df -i` - For detailed disk usage per directory: `du -sh /path/to/directory/`

7. How do you monitor system logs, and which logs are critical in production support?

- Answer: - Logs are typically stored in `/var/log/`. - Critical logs include: - `/var/log/messages` or `/var/log/syslog`: General system logs. - `/var/log/secure` or `/var/log/auth.log`:

Authentication logs. - ``/var/log/dmesg``: Kernel ring buffer logs. - Use commands like ``tail -f`` to monitor logs in real time: `tail -f /var/log/messages`

Unix Interview Questions for Production Support: An Expert Guide to Mastering the Essential Skills In the fast-paced environment of production support, having a solid understanding of Unix is not just a bonus—it's a necessity. Organizations rely heavily on Unix-based systems for their stability, security, and performance.

For professionals aiming to excel in roles that involve maintaining, troubleshooting, and optimizing these environments, preparing for Unix interview questions becomes a critical step. This article offers an in-depth exploration of the most common and essential Unix interview questions tailored specifically for production support roles, providing comprehensive explanations and insights to help you stand out.

Understanding the Importance of Unix in Production Support

Unix systems form the backbone of many enterprise applications, databases, and critical infrastructure. Their robustness, multi-user capabilities, and scripting abilities make them ideal for production environments where uptime and efficiency are paramount. Production support professionals must possess a nuanced understanding of Unix commands, file systems, process management, networking, and security to swiftly resolve issues and ensure system health.

Core Unix Concepts and Interview

Questions

1. What are the key features of Unix that make it suitable for production environments?

Answer: Unix's suitability for production stems from several core features:

- **Stability and Reliability:** Unix systems are known for their robustness, often running for extended periods without failure. This stability is vital for production environments where downtime is costly.
- **Multi-user and Multi-tasking:** Supports multiple users and processes simultaneously, facilitating collaborative work and efficient resource utilization.
- **Security:** Built-in security mechanisms, including file permissions, user authentication, and process isolation, protect sensitive data and operations.
- **Portability:** Unix's architecture allows it to run on diverse hardware platforms, making it adaptable to various infrastructure needs.
- **Extensibility and Scripting:** Powerful scripting capabilities (sh, bash, awk, sed) enable automation of routine tasks, reducing manual intervention and error.
- **Networking Capabilities:** Native support for TCP/IP protocols facilitates network communication essential for distributed

systems.

2. Explain the Unix directory structure and its significance in production support.

Answer: Unix employs a hierarchical directory structure starting from the root directory (`/`). Key directories include: - `/bin` and `/sbin`: Essential user and system binaries required for system operation and maintenance. - `/etc`: Configuration files for the system and applications. - `/home`: User home directories. - `/var`: Variable data like logs, mail, and spool files. - `/tmp`: Temporary files. - `/usr`: User programs and utilities. - `/lib`: Shared libraries needed by binaries. In production support, understanding this structure is crucial because: - It helps locate configuration files (`/etc`), logs (`/var/log`), and executables (`/bin`, `/usr/bin`). - Proper navigation and management of these directories allow efficient troubleshooting. - Knowledge of standard directory contents aids in identifying misconfigured files or corrupted data.

3. How do you check the current Unix

system status and performance metrics?

Answer: Monitoring system health is fundamental in production support. Common commands include: - ``top``: Displays real-time CPU, memory, and process usage. - ``uptime``: Shows system uptime, load average, and number of users. - ``vmstat``: Provides virtual memory statistics, process information, and CPU activity. - ``free -m``: Reports memory usage in megabytes. - ``iostat``: Monitors disk I/O activity. - ``ps -ef`` or ``ps aux``: Lists running processes with detailed info. - ``sar``: Collects, reports, and saves system activity data over time. Regularly analyzing these metrics helps preempt issues and optimize resource allocation.

Process Management and Troubleshooting in Unix

4. How do you identify and terminate a runaway process?

Answer: Runaway processes can consume excessive resources, degrading system performance. The typical approach involves: - Identify the process: Use

`ps` or `top`: `ps -ef | grep` or `top` - Note the process ID (PID): From the output, find the PID associated with the process. - Terminate the process: Use `kill`: `kill` If the process doesn't terminate gracefully, force kill: `kill -9` Best Practices: Always verify the process before killing to avoid terminating critical system processes.

5. What is the difference between `ps`, `top`, and `htop` commands?

Answer: - `ps`: Provides a snapshot of current processes at a specific point in time. It is non-interactive and used for detailed process inspection. Example: `ps -ef` - `top`: An interactive real-time process viewer that updates periodically, displaying CPU, memory, and process information. - `htop`: An enhanced, user-friendly, interactive process viewer similar to `top`, with features like process tree view, color coding, and easier navigation. In production support, `ps` is useful for quick snapshots, while `top` and `htop` aid in real-time monitoring and troubleshooting.

File System and Disk

Management

6. How do you check disk space usage and identify large files?

Answer: - Check disk space: Use ``df -h`` to display disk space usage in human-readable format: `df -h` - Identify large files: Use ``find`` combined with ``du``:
`find / -type f -exec du -h {} + | sort -rh | head -20`
Alternatively, for a specific directory: `du -sh /path/to/directory/` Best Practice: Regular disk checks prevent storage issues that could lead to system failures.

7. How do you mount and unmount filesystems?

Answer: - Mounting: Use the ``mount`` command:
`mount /dev/sdXn /mnt/mount_point` Replace ``/dev/sdXn`` with the device identifier and ``/mnt/mount_point`` with the directory where you want to mount. - Unmounting: Use the ``umount`` command: `umount /mnt/mount_point` Note: Ensure no processes are using the filesystem before unmounting to avoid errors.

Networking in Unix Production Support

8. How do you verify network connectivity between servers?

Answer: Common methods include: - Ping: Checks reachability: `ping` - Traceroute: Tracks the path packets take: `traceroute` - Telnet or nc (netcat): Tests port accessibility: `telnet` or `nc -zv` - Netstat: Displays active network connections: `netstat -an`

9. How do you troubleshoot DNS resolution issues?

Answer: Steps include: - Check if DNS is reachable: `nslookup` - Verify `/etc/resolv.conf` contains correct nameserver entries. - Use `dig` to analyze DNS responses: `dig` - Confirm no firewall rules block DNS traffic. Proper DNS resolution is critical for application connectivity and troubleshooting network-related problems.

Security and Access Management

10. How do you check for unauthorized access or suspicious activity?

Answer: Monitoring logs and processes is essential: - Review `/var/log/auth.log` or `/var/log/secure` for login attempts. - Use `last` to see recent logins: `last` - Check for unusual processes with `ps` or `top`. - Use `netstat` or `ss` to identify unexpected network connections. - Employ intrusion detection tools like `AIDE` or `OSSEC` for ongoing monitoring.

11. How do you manage user permissions and roles?

Answer: - Use `chmod` to set file permissions: `chmod 755 filename` - Use `chown` to change ownership: `chown user:group filename` - Manage user roles via groups: `groupadd` `usermod -aG` - Ensure principle of least privilege is followed, granting only necessary permissions.
