2. Heat Treatment

Heat treatment alters the microstructure of materials to improve mechanical properties such as hardness, toughness, and ductility.

1. **Annealing:** Softens materials and relieves internal stresses.
2. **Quenching and Tempering:** Increases hardness and strength while maintaining toughness.
3. **Austempering and Martempering:** Achieve specific microstructures for wear resistance.

Kalpakjian emphasizes understanding phase transformations and cooling rates to tailor properties for specific engineering applications.

3. Surface Engineering

Surface processes improve surface properties such as wear resistance, corrosion resistance, and friction.

1. Processes include coating, plating, anodizing, and surface hardening techniques like carburizing or nitriding.
2. Application of coatings like thermal spray or PVD (Physical Vapor Deposition) enhances surface performance.

These techniques extend the life of components and enhance their suitability for demanding environments.
